

PALLET STRETCH WRAP VENTX

Ventilated reinforced stretch wrap

The perfect solution for wrapping products likely to get damaged by ripening gases, humidity, rust, mould or condensation, as well as products that need to chill or to freeze quickly. VentX stretch wrap is a reinforced ventilated film. The 'breathable' stretch wrap also reduces the colling time for hot-fill foods. Air can circulate while reinforcements in the film eliminate breakages and improve load containment.

Avoid fresh produce damage

Ideal for wrapping loads of fresh produce that are likely to get damaged by ripening gases, humidity and mould. VentX can prolong the shelf life of fresh produce by allowing it to breathe while in storage and transit.

Reduce freezing time

Perfect for wrapping loads that require fast cooling, unlike with conventional stretch wrap, which insulates the load and increases cooling time. VentX ventilation allows reductions in freezer temperature allowances, reducing energy consumption and electricity costs in chill rooms.

Prevent damaged hot loads

Wrapping pallets of hot fill products with VentX ventilated film allows the load to breathe, preventing rust and condensation.
